sources, using set of distinct gene specific primers. Example 3; SEQ ID NO 400; 11pp; English SSSSSSSSSSSS

The invention relates to producing a sub-population of labeled nucleic acids (NAs) comprising contacting a NA sample from a physiological source, with a pool of 50 distinct gene specific primers under suitable conditions to enzymatically generate sub-population of NAs, where each gene specific primer has a sequence complementary to a distinct mRNA, an

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (TG)n >9 microsatellites in the bovine estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the

The present sequence represents an antisense primer which is used to inhibit expression of the rat connective tissue growth factor (CTGF) gene. The polypeptide may play a significant role in the normal development, growth and repair of mammalian tissue. Antisense sequences can be used to inhibit the expression of CTGF in a cell. In particular, the antisense sequences are useful for andiorating cell in particular, the antisense sequences are useful for andiorating cell proliferative tissue cells. The regulation of CTGF e.g. overgrowth of cells, e.g. connective the disorders, which can be treated, are chosen from sclearoderma, arthritis, cirnhosis, hepatic fibrosis, renal fibrosis, atherosclerosis, cardiac fibrosis, adhesions and surgical scarring. The antisense sequences can also be used to detect expression of CTGF in a sample
sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AA29483-514 represent sequences from Haliotis discus, used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New rat connective tissue growth factor, its related gene and antisense sequences useful for modulating CTGF and treatment of cell proliferative disorders.

The polypeptide may play a significant role in the normal development, growth and repair of mammalian tissue. Antisense sequences can be used to inhibit the expression of CTGF in a cell. In particular, the antisense sequences are useful for ameliorating cell proliferative disorders associated with CTGF, e.g. overgrowth of cells, e.g. consisting the disorders, which can be treated, are chosen from scleroderma, arthritis, cirrhosis, hepatic fibrosis, renal fibrosis, atherosclerosis, cardiac fibrosis, adhesions and surgical scarring. The antisense sequences can also be used to detect expression of CTGF in a sample

                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to nucleic acid molecules from regions of the soybean genome which are associated with soybean cyst nematode (SCN) resistance. The nucleic acids are used to transform plants, and can produce soybean plants having an rhgl or an Rhg4 SCN resistant allele. The nucleic acids can be used for investigating rhg1 or Rhg4 haplotypes of soybean plants and for introgressing SCN resistance or partial SCN resistance into soybean plants. They can also be used in plant breeding programmes. The invention also relates to proteins encoded by such nucleic acid molecules, as well as antibodies capable of recognising these proteins. The present sequence is a primer used to amplify a region
                                                                                                                                                                                                                                                                                                                                                                      New purified nucleic acid for producing a soybean plant having soybean cyst nematode resistance and for use in plant breeding programs.

Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the proces. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor addrected primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a compound SSR primer method represents a modified amplified fragment length polymorphism assay, which is partic, useful for genome fingerprinting, i.e. for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Single nucleotide polymorphism; SNP; single nucleotide primer extension; SNPE; genotyping; agammaglobulinaemia; diabetes insipidus; cancer; Lesch-Nyhan syndrome; muscular dystrophy; familial hypercholesterolaemia; polycystic kidney disease; osteogenesis imperfecta; autoimmune disease; acute intermittent porphyria; rheumatoid arthritis; multiple sclerosis; inflammation; forensic investigation; paternity analysis; PCR primer; ss.

primer extension (SNPE) primers, and the sequences of regions flanking stees of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the includes kits for determining the presence or absence of a SNP, using the cligonucleotides of the invention. The PCR primers are used to amplify a coligonucleotides of the invention. The PCR primers are used to amplify a coligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or dentity of a SNP and for genotyping nucleic acid sample by coligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, besch Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and caute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to wulltifactorial catesase, including, rheumacoid arthritis, multiple sclerosis, contenting and inflammantion, cancer, nervous system diseases and infection and canterinty analysis. The present sequence represents a PCR primer specific contentity annalysis. The present sequence represents a PCR primer specific contents a human SNP containing DNA sequence
                                                                                                                                  New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR; selection; primers; OPTIPRIM; breeding; cattle; parentage;

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 screening a library of bovine Mbol DNA fragments of between 250 and 500 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information of cor ca. 230 such bovine microsatellites is summarised in the sequence information specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at .300. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information of chemicrosatellites sequence were used to generate the sequence PR primers for in vitro amplification of the corresp.

In crosatellite (using the program oPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonuclectide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR; selection; primers; OPTIPRIM; breeding; cattle; parentage; genetic mapping; traits; amplification; ss.

One out of 50 closes cross-lybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100,000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein. (see below). The sequences upstream and downstream of the microsatellite amplification of the corresp. microsatellite (using the program OPTIRRIM). The microsatellites may be used to identify individuals, for general extensions of the description of the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on
microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mool DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligomucleotide probe. One out of 50 closes cross-hybridised. Assuming independent distribution of microsatellites and Mool sites, the frequency of (TG)10 y microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of the conomic trait loci, or genes involved the determinism of the conomic allow appoints the program of the conomic allow asserting and the program of the conomic allow asserting and the program of the conomic part loci, or genes involved the determinism of the conomic and the program of the conomic part loci, or genes in callow asserting and the program of the conomic part loci, or genes in callow asserting and the program of the conomic part loci, or genes in callow asserting and the program of the conomic part loci, or genes in callow asserting the program of the conomic part loci, or genes in callow asserting the program of the conomic part loci, or genes in callow asserting the program of the conomic part loci or and lock asserting the program of the conomic part loci or and lock asserting the program of the conomic part loci or and lock asserting the program of the conomic part loci or and lock asserting the program of the conomic part loci or and lock asserting the program of the conomic part loci or and lock asserting the conomic part loci or and lock asserting the loci or and lock asserting the loci or and lock asserting the l
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    reeding. Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

Georges M, Massey JM; WPI; 1992-284684/34.

(GENM-) GENMARK.

Table 7; Page 388; 517pp; English.

```
The sequence is that of a bovine microsatellite sequence obtd, by screening a library of bovine MboI DNA fragments of between 250 and 500 by that an (ACI)5 and a (TCI)5 oligomucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information of specification and indexed herein (see below). The sequence information of equivalent of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economic trait loci, or genes involved the determinism of the correct PN individuals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                       The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-da)n. (dd-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dc-dh). (dc-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf31 which contains the repeat sequence is from formula: (AC)13A. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                             4
                                                                                                                                                                                                                                                                                        Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic oligonucleotide, dinucleotide repeat, cytostatic, apoptosis, cell cycle arrest, cell proliferation, caspase, cytokine, interleukin, tumour necrosis factor, TNF, cancer, carcinoma, sarcoma, leukemia,

The present sequence is that of a synthetic oligonucleotide useful to the invention. The invention relates to a composition, comprises multiple base 3'-OH, 5'-OH synthetic oligonucleotide which comprises multiple repeats of dinucleotides such as GT, TG, etc., according to specific commula and having cytostatic activity. The oligonucleotide compositions are useful for inducing cell cycle arrest, inhibition of profileration, activation of caspases and induction of apoptosis or production of activation of caspases and induction of apoptosis or production of cytokines such as interleukin (IL)-1-beta, IL-6, IL-10, IL-12 and tumour necrosis factor (INF)-alpha by immune system cells, in an animal having cancer such as primary carcinoma, secondary sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, ovarian or bone cancer. The compositions induce apoptosis independent of Fas, p53/p21, p21/waf-1/CIP, p15(ink4B), p16(ink4), drug resistance, caspase 3, transforming growth factor (TGF)-beta 1 receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                          Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for genetic trait marking and germplasm comparisons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bovith an (AC)15 and a (TC)15 oligonuclectide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the
                Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polymorphic bovine DNA markers - used in genetic identification,

The sequence is that of a bovine microsatellite sequence obtd. by acceeding a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information of specification and indexed herein (see below). The sequence information construction and indexed herein (see below). The sequences upstream and construction and indexed herein (see below). The sequence the required PCR primers for in vitro amplification of the corresp.

The microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-WAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence is that of a bovine microsatellite sequence obtd, by screening a library of bovine MboI DNA fragments of between 250 and 500 by that an (AC115 and a (TC1)15 oligomucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information of or ca. 230 such bovine microsatellites is summarised in the sequence information consistent on and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loit, or genes involved the determinism of economic trait raits esp. in cattle, to allow selective breeding. The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used to detect these markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Of ones containing the animal or plant breeding or pedigree analysis of of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated, The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence is from the marker clone Mdf32 which contains the repeat sequence is from the marker clone Mdf32 which contains the repeat sequence is from the marker clone Mdf32 which contains the repeat sequence is from the marker clone Mdf32 which contains the repeat sequence is from the marker clone Mdf32 which contains the repeat sequence is from the marker clone Mdf32 which contains the repeat sequence is from the marker clone Mdf32 which contains the repeat sequence having the
Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligomucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100,000. The sequence information of specification and indexed herein (see below). The sequence information specification and indexed herein (see below). The sequences upstream and sommarream of the microsatellite sequence water used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC1)5 and a (TC)15 oligomuclecited probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information in the bovine genome is estimated at >100, 000. The sequence information conspecification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by thin an (AC115 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information for ca. 230 such bovine microsatellites sequence were used to generate the sequence por the microsatellite sequence were used to generate the required por primers for in vitro amplification of the corresp.

The sequence of the microsatellite sequence were used to generate the required por primers for in vitro amplification of the corresp.

The sequence of identify individuals, for parentage testing, and in the genetic used to identify individuals, for parentage testing, and in the genetic economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonuclectide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming in the probe. One out of 50 microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the required PCR primars for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trail loci, or genes involved the determinism of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN field.)

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 close that ha (ACI)15 and a (TCI)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites and microsatellites is summarised in the powine genome is estimated at >100, 000. The sequence information of for ca. 230 such bowine microsatellites is summarised in the specification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

```
This sequence represents an oligonucleotide clamp which was used to bind a target sequence comprising a segment of the HIV pol and nef genes in single stranded or double stranded forms. This molecule forms a loop-and-branch configuration. An oligonucleotide clamp is a compound capable of forming a covalently closed macromolecule or a stable circular complex of forming a covalently closed macromolecule or a stable circular complex clamps generally comprise one or more oligonucleotide moieties capable of specific binding to the target molecule and one or more pairs of binding moieties covalently linked to the oligonucleotide moieties. Upon annealing of the oligonucleotides moieties to the target polynucleotide, the binding moieties of a pair are bought into juxtaposition so that they complex moieties of the binding moieties effectively clamps the specifically interaction of the binding moieties effectively clamps the specifically connealed oligonucleotides moieties to the target polynucleotide. The invention relates to compositions for the treatment of cancers, comprising purified hyaluronic acid (HA) and a second antineoplastic comprising purified hyaluronic acid (HA) and a second antineoplastic comprising burified hyaluronic acid (HA) and a second antineoplastic object antineoplastic oligonuclectide. On its own, HA stimulates the production at incertainty of interpretainty of the cytokines interleukin-6 (IL-6) and IL-12 by immune system cells. Or combination, HA and the second antineoplastic agent of the composition act synergistically to potentiate each other's ability to inhibit of proliferation and induce apoptosis in cancer cells. Due to the synergy between the HA and the second antineoplastic agent, a reduced standard cose of the second antineoplastic agent can be used without compromising the therapeutic effectiveness of the cancer treatment. The reduction in cose the patient. In addition, as HA is inexpensive and as most cohemotherapeutic drug are expansive, thereby improving the quality of life chemotherapeutic drug are expansive, the combined use of that an decrease in cost address provide important benefits for mammals, concluding humans. The present sequence repersents a synthetic antineoplastic oligonucleotide which was used in a composition with HA in exemplification of the invention
                                                                                                                                                           Antineoplastic oligonucleotide; hyaluronic acid; HA; cytokine production; interleukin; IL-6; IL-12; synergistic action; standard dose reduction; side-effect reduction; drug resistance reduction; immunosensitisation reduction; cancer; tumour; cytostatic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Symergistic compositions comprising hyaluronic acid and Mycobacterium phlei DNA and cell walls, useful for treating cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

The present sequence is that of a synthetic cligonuclectide useful to the invention. The invention relates to a composition, comprising a 2 to 20 base 3'-OH, 5'-OH synthetic oligonuclectide which comprises multiple repeats of dinuclectides such as QT, TG, etc., according to specific formula and having cytostatic activity. The oligonuclectide compositions are useful for inducing cell cycle arrest, inhibition of proliferation, are useful for inducing cell cycle arrest, inhibition of proliferation, cytokines such as interleukin (IL)-1.beta, IL-6, IL-10, IL-12 and tumour necrosis factor (INF)-alpha by immune system cells, in an animal having cancer such as primary carcinoma, secondary carcinoma, primary sarcoma and secondary sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, ovarian or bone cancer. The compositions induce apportesis induceable apportesis is independent of Fas, p53/p21, p21/waf-1/CIP, p15(ink4B), p16(ink4), drug resistance, caspase 3, transforming growth factor (TGF)-beta 1 receptor
                                                                                 Synthetic oligonucleotide; dinucleotide repeat; cytostatic; apoptosis; cell cycle arrest; cell proliferation; caspase; cytokine; interleukin; tumour necrosis factor; TNF; cancer; carcinoma; sarcoma; leukemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Composition comprising synthetic oligonucleotides which comprise multirepeats of dinucleotides such as GT, TG useful for treating cancer by inducing cell cycle arrest, inhibiting proliferation, activating

                                                                                                                                                                                                                                                                                              The present sequence is that of a synthetic oligonuclectide useful to the invention. The invention relates to a composition, comprises multiple base 3 -04H, 5.-0H synthetic oligonuclectide which comprises multiple repeats of dinuclectides such as GT. TG, etc., according to specific formula and having cytostatic activity. The oligonuclectide compositions are useful for inducing cell cycle arrest, inhibition of proliferation, crivation of caspases and induction of apoptosis or proliferation, crivation of caspases and induction of apoptosis or proliferation. The cancer such as interleukin (IL)-1-beta, IL-6, IL-10, IL-12 and tumour necrosis factor (TNP)-alpha by immune system cells, in an animal having cancer such as primary carcinoma, secondary carcinoma, primary sarcoma and secondary sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, ovarian or bone cancer. The compositions induce apoptosis independent of Fas, p53/p21, p21/waf-1/CIP, p15(ink4B), p16(ink4), drug resistance, caspase 3, transforming growth factor (TGF)-beta 1 receptor

                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for synthesising a branched or multiply connected macromolecular structure, comprising oligonuclectide clamps (OC). The macromolecular structure is capable of specifically binding to a target molecule, and can therefore be used as probes. At least one OC comprises a target binding sequence that binds specifically and stably with the target molecule, and at least two OCs comprise signal generation moieties capable of generating a detectable signal in the presence of the target molecule. In addition the OCs are connected to one another by thioalkylamino, or thiophosphorylalkylamino bridges. The present sequence is an OC used in the present invention
                                                                                                                                                                                                                                              Synthesizing branched nucleic acids useful as diagnostic and molecular probes, involves combining first units having haloalkylamino groups and second units having thiol or phosphorothicate groups.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ģ

One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and donstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be
screening a library of bovine Mbol DNA fragments of between 250 and 500 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (76)n >9 microsatellites and mbol sites, the frequency of (76)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence information specification and indexed herein (see below). The sequence upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be microsatellite (using the program OPTIPRIM). The microsatellites may be enonemic trail loci, or genes involved the determinism of economic trails esp. in cattle, to allow selective breeding. See also AAQ33501-34437. The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information of specification and indexed herein (see below). The sequence information of committee for microsatellite sequence were used to generate the cequired PCR primers for in vitro amplification of the corresp. microsatellite (using the program oPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trail loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic enalysis such as linkage analysis of genetic disease, commercial animal or plant breadthy or pedigree analysis. The sequences AAT66084-166107 represent repeat sequences of low informativeness found in chromosomal clone SW13. The sequence is found in the human chromosomal clone SW13. The sequence is amplified by primers AAT66106-7. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                     Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols, as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a single-nucleotide primer is used as a genotyphing primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid sample by performing a single-nucleotide primer extension reaction. The cligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid sample by performing a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include disease e.g. caterosis imperfects and acute intermittent porphyria. Phenotypic craits also include symptomes of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune configurates also include symptoms of or susceptibility to multifactorial diseases, including, rheumatoid arthritis, multiple sclerosis.

Configurates also include symptoms system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and microorganism propertices.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 screening a library of bovine MboI DNA fragments of between 250 and 500 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100,000. The sequence information of specification and indexed herein (see below). The sequence information constream of the microsatellite sequence ware used to generate the microsatellite sequence ware used to generate the microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information of or ca. 230 such bovine microsatellites is summarised in the sequence information of specification and indexed herein (see below). The sequences upstream and specification and indexed herein (see below). The sequences upstream and commistream of the microsatellite sequence were used to generate the required prayments for in vitro amplification of the corresp.

The construction of economic trait loci, or parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective to breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                        - used in genetic identification, gene

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by thin an (AC1)5 and a (TC)15 oligomiclecited probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information of cor ca, 230 such bovine microsatellites is summarised in the sequence information of specification and indexed herein (see below). The sequences upstream and specification and indexed herein (see below). The sequences upstream and constructed PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in catelle, to allow selective breeding. ine bequence is that on a bovine microsacellite sequence obled. by graceful alphrary of bovine Mbol DNA fragments of between 250 and 500 by with an (AC)15 and a (FC)15 oligomucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of 6 microsatellites and Mbol sites, the frequency of (FG)n >9 microsatellites on the bovine genome is estimated at >100, 600. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence information for ca. 230 such bovine microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be nicrosatellite (using the program oPTIPRIM). The microsatellites may be expensed to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective in the correct PN is presedung.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligomucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (TG)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

The sequence is that of a bovine microsatellite sequence obtd. by creening a library of bovine MboI DNA fragments of between 250 and 500 cc bp with an (AC)15 and a (TC)15 oligonuclectide probe. One out of 50 cc ones cross-hybridised. Assuming independent distribution of fractions cross-thybridised. Assuming independent distribution of fractions and MboI sites the frequency of (T6)n >9 microsatellites and MboI sites the frequency of (T6)n >9 microsatellites on the bovine genome is estimated at >100, 000. The sequence information of for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the credited PCR primers for in vitro amplification of the corresp.

Trequired PCR primers for in vitro amplification of the corresp.

The microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of connecting important traits esp. in cattle, to allow selective in field.)
microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-dA)n. (dg-dT)n which can be used to detect these markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. The sequences AAT66084-T66107 represent repeat sequences of low informativeness found in specific human genes. This repeat sequence is found in the human chromosomal clone JW42. The sequence is amplified by primers AAT66097-8. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

necrosis factor; TNF; cancer; carcinoma; sarcoma; leukemia; lymphoma; ss. Best Local Matches δ g The present sequence is that of a synthetic oligonucleotide useful to the invention. The invention relates to a composition, comprises multiple base 3'-04, 5'-0H synthetic oligonucleotide which comprises multiple repeats of dinucleotides such as GT, TG, etc., according to specific formula and having cytostatic activity. The oligonucleotide compositions are useful for inducing call cycle arrest, inhibition of proliferation, activation of caspases and induction of apoptosis or production of activation of caspases and induction of apoptosis or production of cytokines such as interleukin (IL)-1-beta, IL-6, IL-10, IL-12 and tumour necrosis factor (TNF)-alpha by immune system cells, in an animal having cancer such as primary carcinoma, secondary carcinoma, prostate, and secondary sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, ovarian or bone cancer. The compositions induce apoptosis independent of Fas, p53/p21, p21/waf-1/CIP, p15(ink4B), p16(ink4), drug resistance, caspase 3, transforming growth factor (TGF)-beta 1 receptor Composition comprising synthetic oligonuclectides which comprise multiple repeats of dinuclectides such as GT, TG useful for treating cancer by inducing cell cycle arrest, inhibiting proliferation, activating caspases. Synthetic oligonucleotide 16.

Synthetic oligonucleotide, dinucleotide repeat; cytostatic; apoptosis; cell cycle arrest; cell proliferation; caspase; cytokine; interleukin;

The present sequence is that of a synthetic oligomucleotide useful to the invention. The invention relates to a composition, comprises multiple base 3'-OH, 5'-OH synthetic oligomucleotide which comprises multiple repeats of dinucleotides such as GT, TG, etc., according to specific commis and having cytostatic activity. The oligomucleotide compositions are useful for inducing cell cycle arrest, inhibition of proliferation, cutivation of caspases and induction of apoptosis or production of cytokines such as interlenkin (IL) 1-beta, IL-6, IL-10, IL-12 and tumour nerosis factor (TMF)-alpha by immune system cells, in an animal having cancer such as primary carcinoma, secondary carcinoma, present of secondary sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, ovarian or bone cancer. The compositions induce apported to Fas, p53/p21, p21/waf-1/CIP, p15(ink4B), p16(ink4), drug resistance, caspase 3, transforming growth factor (TGF)-beta 1 receptor ö Composition comprising synthetic oligonucleotides which comprise multiple repeats of dinucleotides such as GT, TG useful for treating cancer by inducing cell cycle arrest, inhibiting proliferation, activating 0; Gaps / Match 2.0%; Score 21.4; DB 1; Length 24; Local Similarity 95.7%; Pred. The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antianglogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antianglogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid turnour growth, turnour metastasis, precancerous leason, rheumatorid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, evascular glaucoma, retrolental fibroplasia, rubecsis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, your metastasis, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic administration.
                                                                                                                                                                                                                                                                                                           Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Immunostimulatory, antiinflammatory, dermatological, antipsoriatic; antiulcer; gene therapy, vaccine, non-allergic inflammatory disease; psoriasis, eczema, allergic contact dermatitis, latex dermatitis; inflammatory bowel disease, ulcerative colitis, crohn's disease; ss. inflammatory bowel disease, ulcerative colitis, crohn's disease; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Angiogenesis inhibitor; ss; angiogenesis; solid tumour growth; tumour metastasis; psecancerous lesion; rheumatorid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               rubeosis; Osler-Webber Syndrome; myocardial anglogenesis; plaque neovascularisation; telangiectasia; haemophiliac joint; anglofibroma; wound granulation; intestinal adhebion; atherosclerosis; scleroderma; hypertrophic scar.

The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                   The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing ann-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Croin's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ds; allergy; asthma; poly-G nucleic acid; aerosol formulation; hypo-responsive subject; immunostimulatory.

The sequence is that of a bovine microsatellite sequence obtd, by screening a library of bovine MboI DNA fragments of between 250 and 500 screening a library of bovine MboI DNA fragments of between 250 and 500 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100,000. The sequence information of cor ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence information committee propries for in vitro amplification of the corresp. microsatellite (using the program oPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trail loci, or general the determinism of economically important trails esp. in cattle, to allow selective breeding. New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic acid sample.

Claim 1; Page 65; 83pp; English.

primer extension (SNPB) primers, and the sequences of regions flanking after extension (SNPB) primers, and the sequences of regions flanking interests are used to said a single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the includes kits for determining the presence or absence of a SNP, using the coligonucleotides are useful for genetyping a mucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for genetyping a mucleic acid sample by performing a single-nucleotide primer extension reaction. The cliquoucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid sample by performing a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolesmia, polycystic kiney disease.

Coffeentophy, familial hypercholesterolesmia, polycystic kiney disease, captering and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a single nucleotide paterning DNA primer extension (SNPE) primer specific for a human SNP containing DNA

New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic acid sample.

Claim 1; Page 55; 83pp; English

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide continues that the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a coligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The clientity of a SNP and for genotyping uncleic acid sample by clientity of a SNP and for genotyping nucleic acid sample by clientity of a SNP and for genotyping uncleic acid samples, for e.g. clientity of a SNP and for genotyping nucleic acid samples, for e.g. clientity of a snear SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being agammaqlobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, of extended single-fects and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial diseases of which a component is or may be genetic such as autoimmune configuration, cancer, nervous system diseases and infection by pathogenic microrganism. The method is also useful in forensic investigations and microcraganism. The method is also useful in forensic investigations and contraining number of presents a single mucleotide. primer specific for a human SNP containing DNA paternity analysis. The present sequence primer extension (SNPE) primer specific sequence

The sequence is that of the target sequence #8 which was used in an experiment to determine the in vitro cleavage of target duplaces to evaluate the lengths of purine and pyrimidine tracts which are useful in obtaining oligonuclectides capable of triple helix formation with target nucleic acids. The complementary strand overhangs the 3' and by the sequence CTAG and the sense strand overhangs the complementary strand by the sequence AATT. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                           New oligo:nucleotide(s) forming triple helix with target nucleic acid contain purine and pyrimidine tracts in specific orientations, useful therapeutically or diagnostically e.g. for inactivating HIV RNA, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polymorphic bovine DNA markers - used in genetic identification, gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequences given in AAQ41176-77 represent triplex forming oligonatic locals mucleotides which bind to the mRNA sequence of the MHC class II locus DR A structural gene at positions 851-876. The sequences given in AAQ47176-80 represent control oligomers which contain base compositions similar to that around this DR A region but not containing the correct sequences. DR is a transplantation antigen. Binding of this sequence to the DR A gene inhibits antigen production. This method may be used for treating individuals with autoimmune disease, characterised by dysfunctional cappession of a transplantation antigen. It may also be used to produce cells which are more easily transplanted into a recipient. (Updated on 25-003 to correct PN file1d.)

The sequence is that of a bovine microsatellite sequence obtd, by screening a library of bovine MboI DNA fragments of between 250 and 500 by thin an (AC.)15 and a (TC.)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100,000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information consistence of the microsatellite sequence were used to generate the required pCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits egp. in cattle, to allow selective in the correct PN is in the correct of the correct PN is included the correct of the co

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to the isolation of polymorphic repeat sequences having the sequence (dd-dh)n.(dd-dl)n be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific plage libraries with a synthetic poly(dd-dh). (dd-dl) probb. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65798-T66047. Those clones where the repeat sequence has been determined are shown in AAT65704-777. This repeat sequence is from the marker clone MdE37 which contains the repeat sequence is from the marker clone MdE37 which contains the repeat sequence is from formula: (AC)10A. (Updated on 25-MAR-2003 to correct PF field.)
          specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIRRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. The present sequence is that of a synthetic oligonuclectide useful to the invention. The invention relates to a composition, comprising a 2 to 20 base 3 'OH, 5 'OH synthetic oligonucleotide which comprises multiple repeats of dinucleotides such as GT, TG, etc., according to specific formula and having cytostatic activity. The oligonucleotide compositions are useful for inducing cell cycle arrest, inhibition of proliferation, activation of caspases and induction of apoptosis or production of activation of caspases and induction of apoptosis or production of activation of caspases and induction of apoptosis or production of activation of activation of such as interleukin (IL)-1.beta, IL-6, IL-10, IL-12 and tumour necrosis factor (TNF)-alpha by immune system cells, in an animal having cancer such as primary carcinoma, secondary carcinoma, primary sarcoma and secondary sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, ovarian or bone cancer. The compositions induce apoptosis is independent of Fas, p53/p21, p21/waf-1/CIP, p15(ink4B), p16(ink4), drug resistance, caspase 3, transforming growth factor (TGF)-beta 1 receptor.
                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Composition comprising synthetic oligonucleotides which comprise multiple repeats of dinucleotides such as GT, TG useful for treating cancer by inducing cell cycle arrest, inhibiting proliferation, activating

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects adjanst tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, alleryy or immune deficiency. The present sequence can also be used to redirect a Thi immune response and to activate immune cells. Note: the
                                                                                                                                                                                                                                                                             Vaccine, cytostatic, virucidal, bactericidal, fungicidal, anti-parasitic, immunostimulatory, tumour, viral infection, bacterial infection, fungal infection, parasitic infection, cancer, asthma; infectious disease, allergy, immune deficiency, phosphorothioate, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vaccinating against tumors, infectious diseases, allergies and asthmausing immunostimulatory Py-rich and TG nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, osler-Webber Syndrome, myocardial angiogenesis plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                    Angiogenesis inhibitor; ss; angiogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiactasia; haemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           hypertrophic scars. The present sequence is an antianglogenic nucleic acid of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human connective tissue growth factor, RT-PCR primer #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 21 BP; 0 A; 0 C; 10 G; 11 T; 0 U; 0 Other;

The present invention relates to endothelial cell-specific molecule 4

(ECSM4), and the polynuclectide sequences encoding it. The ECSM4 proteins are deful for imaging vascular endothelium in the body of an individual, and for diagnosing and treating a proliferative disease or condition involving the vascular endothelium (preferably, neovasculature) such as cancer, psoriasis, diabetic retinopathy, atheroscierosis or menorrhagia. The ECSM4 proteins are also useful in the manufacture of diagnostic or prognostic agent for such conditions. The proteins are also useful for detecting endothelial damage or activation, detecting a tumour or neovasculature, cardiac disease, or endometriosis by detecting the amount of ECSM4 present in a sample. The polynuclectide sequences encoding ECSM4 are useful in gene therapy for treating a hypoxic condition such as cancer, cardiac disease, endometriosis or atherosclerosis and in the manufacture of medicaments for treating the above disease. The sequences care useful for modulating angiogenesis in an individual. The present sequence represents a RT-PCR primer for RNA encoding human connective tissue growth factor
                    imaging vascular endothellum, proliferative disease, cancer, psoriasis, dibbetic retinopathy, atherosclerosis, menorrhagia, endothelial damage, tumour neovaeculature, cardiac disease, endometriceis, hypoxic condition, angiogenesis, cytostatic, RT-PCR, connective tissue growth factor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel endothelial cell-specific molecule polypeptide 1 or 4, useful for imaging, diagnosing and treating a condition involving vascular endothelium e.g. cancer, cardiac disease, endometriosis, diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                 The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                              Treating non-allergic inflammatory diseases, such as psoriasis, ecz allergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                       ;

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage teeting, and in the genetic mapping of economic trait loci, or genes involved the determinism of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                    The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligomucleotide probe. One out of 50 increatellites and whorl sites, the frequency of (Tc)n >9 microsatellites and MboI sites, the frequency of (Tc)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information of a ca. 230 such bovine microsatellites is summarised in the sequence information of specification and indexed herein (see below). The sequence information of committee for microsatellite sequence were used to generate the microsatellite (using the program of Tthe amplification of the corresp. microsatellite (using the program OFTIPRIN). The microsatellites may be used to identify individuals, for parencage testing, and in the genetic mapping of economic trait lost, or genes involved the determinism of economic trait cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                               ö
economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN field.)

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information of co. ca. 230 such bovine microsatellites is summarised in the sequence information of specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the cequired PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

The sequences given in AAQ81938, AAQ83952 and AAQ83940 are used in the construction of an oligonuclectide clamp. The clamp is a comb-type obtained bolymer which has 3' termini and was used to bind a target sequence comprising a segment of the HIV pol and nef genes in single stranded forms. An oligonuclectide clamp is a compound capable of forming a covalently closed macromolecule or a stable circular complex after specifically binding to the target polymuclectide in one time sequence capable of specific binding to the target molecule and one or more pairs of binding molecties consorted in the oligonuclectide molecties. Upon annealing of the oligonuclectides molecties to the target into juxtaposition so that they form a stable covalent or non-covalent linkage the specifically annealed oligonuclectides molecties to the target the specifically annealed oligonuclectide molecties to the target the specifically annealed oligonuclectide molecties to the target polymuclectide. The invention relates to the isolation of polymorphic repeat sequences having the sequence (dc-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers AAT65794-7647. Those clones where the repeat sequence has been determined are shown in AAT65704-797. This repeat sequence has been determined are shown in Calone the repeat sequence is from the marker clone Mdf25 which contains the repeat sequence is from the marker clone Mdf25 which contains the repeat sequence having the formula: (AC)11. (Updated on 25-MAR-2003 to correct PF field.)

Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n using novel nucleic acid mols. as primers.

Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.
                                                                                                                                                                                                                                                                                                                Claim 6; Page 35; 52pp; English

```

The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 mucleotide core element which is tandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breading. The SSRs are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which was used in the present invention Sequence 22 BP; 0 A; 0 C; 11 G; 11 T; 0 U; 0 Other;

Synthesizing branched nucleic acids useful as diagnostic and molecular probes, involves combining first units having haloalkylamino groups and second units having thiol or phosphorothioate groups.

Example 7; Col 19; 20pp; English.

The present invention relates to a method for synthesising a branched or multiply connected macromolecular structure, comprising oligonucleotide clamps (OC). The macromolecular structure is capable of specifically binding to a target molecule, and can therefore be used as probes. At least one OC comprises a target binding sequence that binds specifically and stably with the target molecule, and at least two OCs comprise signal generation moieties capable of generating a detectable signal in the AAF60472/AAF

Additional Saguences AAH437205 - AAH40944 represent PCR primers, single nuclectide primer extension (SNPB) primers, and the sequences of regions flanking stres of single nuclectide polymorphisms SNPs. The present invention cancel of includes kites for determining the presence or absence of a SNP, using the oligonuclectides of the invention. The PCR primers are used to amplify a cligonuclectide of the SNPE primer is used as a genotyping primer. SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonuclectides are useful for genotyping a nucleic acid sample by performing a single-nuclectide primer extension reaction. The cligonuclectides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes inspidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease.

C traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune client as including, rheumatoid arthritis, multiple sclerosis, New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polymucleotide polymorphism in a nucleic Claim 1; Page 65; 83pp; English. acid sample.

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNBE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a gnotyping primer. The oligonucleotides are useful for genetyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits inspected of being agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesteroleamia, polycystic kidate disease, osteogenesis imperfects and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial

disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a single nucleotide primer extension (SNPE) primer specific for a human SNP containing DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the 5' anchored (ISSR)-PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inter-simple sequence repeat; ISSR; SSR; PCR; primer; genotyping; plant;

                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (ACILS and a (TC)15 oligomucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100,000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence information of commiscrate for in vitro amplification of the corresp.

Trequired PCR primars for in vitro amplification of the corresp.

The microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine Mbol DNA fragments of between 250 and 500
clones cross-hybridised. Assuming independent distribution of
clones cross-hybridised. Assuming independent distribution of
microsatellites and Mbol sites, the frequency of (76)n >9 microsatellites
in the bovine genome is estimated at >100,000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
sepecification and indexed herain (see below). The sequences upstream and
committed PCR primers for in vitro amplification of the corresp.
microsatellite (using the program of THRMM). The microsatellites may be
microsatellite (using the program of PTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
capping of economic trait loci, or genes involved the determinism of
connandally important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-WAR-2003 to correct PN

```
Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer obsisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor segment. The present sequence complementary to an adaptor segment. The present sequence is an example of a compound SSR primer. The method represents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for genetic trait marking and germplasm comparisons
                                            Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New phospho:di:esteric oligo:nucleotide(s) - which exert a specific and selective cytotoxic effect on tumour cells, for treating both solid and liquid tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antitumoural phosphodiester oligonucleotide 19 with cytotoxic activity.^{\cdot\cdot}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Phosphodiester; selective binding; cell viability; growth; tumoural cell line; cytotoxic activity; tumour cell; lymphoma; lymphoblastic tumour; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                            The sequence is that of a bovine microsatallite sequence obtd. by screening a library of bovine Mool DNA fragments of between 250 and 500 by thin an (ACI)5 and a (TCI)5 oligomiclecide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mool sites, the frequency of (T5)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the sequence information of specification and indexed herein (see below). The sequence information of downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

Microsatellite (using the program OPTIPRIM). The microsatellites may be required to identify individuals for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective condition and the QTL trait of enhanced milk prodn. in Brown Swiss contitle. Rein A, Casas-Finet J, Fisher R, Fivash M, Henderson LE WPI; 1998-018230/02 Oligo:nucleotide which binds to retroviral nucleocapsid protein with high affinity - used in targeted molecules, transduced cells and gene therapy vectors for treatment of retroviral infections such as those caused by

Claim 7; Page 56; 70pp; English.

This sequence represents an oligonucleotide which binds to a retroviral nucleocapsid (NC) protein with high affinity. The invention relates to a targeted molecule which binds to a retroviral nucleocapsid protein with high affinity and comprises the oligonucleotide and a fusion partner. Retroviral nucleocapsid proteins, such as NC and the Gag precursors, bind to specific nucleic acid sequences with high affinity. This binding is hydrophobic component. The specific nucleic acid sequences which bind at the sinc Component. The specific nucleic acid sequences which bind or are useful as molecular decoys for retroviral NC proteins, for making

```

The present invention describes a method (I) for sample displacement chromatography separation. The method comprises applying a multicomponent cample to one end of a chromatography bed, distributing the sample along the bed by passing non-eluting mobile solvent phase over the bed, and recovering a desired component of the sample from at least portion of the bed. The sample components are applied in a non-homogeneous manner to enhance concentration of at least one component with relatively low and/or high affinity for the stationary phase material, respectively, during an earlier and later part of the sample application. The method is useful for chromatographic separation of samples. The method permits recovery of sample components at significantly higher concentrations and generally makes more efficient use of the stationary phase material. The method allows ten-fold greater loading than comparable gradient elution method allows ten-fold greater loading than comparable gradient elution analysis, avoids the use of displacer solution during actual separation analysis, avoids the use of displacer solution during actual separation for the purification of an oligonucleotide by sample displacement Example 2; Page 22; 37pp; English. chromatography

Forster JW, Jones ES; WPI; 2001-512563/56. New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species varieties.

Example 1; Fig 6; 72pp; English.

The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nuclectide core elements 2-6 nuclectide core elements are included are a nucleic acid primar cuitable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and identifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profiling to establish the distinct identity, uniformity and/or stability of a cultivar. The present sequence is a ryegrass or fescue SSR

The present sequence is one of a number of antisense compounds of up to 30 nucleobases in length that are capable of inhibiting the expression of phosphoenom by vivate carboxykinase-cytosolic (FEFCK-cytosolic). The antisense compounds are useful for inhibiting the expression of FEFCK-cytosolic in cells or tissues. They are commonly used as research genes. They are also useful for distinguishing between function of particular various members of a biological pathway and for research use. The antisense compounds are also useful prophylactically, e.g. to redeate of antisense compounds are also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence is a chimeric phosphorothioate oligonucleotide with 2'-MOE wings and a Deoxynucleic S-Methythiourea; DNmt; antisense therapy; cardiovascular disease; neurocellular disease; antiviral therapy; human immunodeficiency virus; human-cytomegalovirus; Antisense compound capable of modulating the expression of phosphoenol pyruvate carboxykinase-cytosolic, useful for preventing or delaying infection, inflammation or tumor formation. The present sequence was used to demonstrate the ability of deoxynucleic S-Methythiourea (DNmt) compounds to form triplexes with DNA oligomers. An increase in the C content of the oligor resulted in a large decrease in the C content of the oligor sesulted in a large decrease in binding. This experiment was performed as an example of a method for preparing oligomucleotides comprising a backbone of alkyl or alkoxy continues in antisense or antigene therapy, to inhibit production of proteins associated with genetic diseases, cardiovascular, inflammatory contents associated with genetic diseases, cardiovascular, inflammatory contents in mennodeficiency virus, human-cytomegalovirus, influenza and herpes content the presence or absence of the target DNA content binding contents and content of activity of a target protein, they can be useful in the manipulation of tissue e.g. tissue e.g. tissue differentiation, both in vivo and in ex vivo tissue cultures. The method provides and S-methylthiourea Preparing novel deoxynucleic alkyl thiourea oligonucleotide for use in antisense therapy, by synthesizing oligonucleotides comprising backbone of alkyl or alkoxy thiourea linkages in solution or on solid phase. Treating systemic lupus erythematosus in individual comprises e.g. administering conjugate comprising non-immunogenic valency platform molecule and double stranded DNA epitopes which specifically bind to antibody from individual.

Claim 4; Page 57; 87pp; English.

The present invention describes a method of treating systemic lupus erythematosus and lupus nephritis, involving administering a conjugate comprising a non-immunogenic valency platform molecule and 2 double stranded DNA epitopes which specifically bind to dsDNA-binding antibodies. Affinity of the epitopes for the antibody is used as a basis for selecting individuals to receive treatment. The present sequence is an antibody binding dsDNA sequence described in the exemplification of the invention

Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profilling legume species varieties and for testing the purity of legume seed batches.

Claim 6; Page 35; 52pp; English.

The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 mucleotided core element which is trandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/legume breeding. The SSRs are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which

The present invention relates to endothelial cell-specific molecule 4

(ECSM4), and the polynuclectide sequences encoding it. The ECSM4 proteins
are useful for imaging vascular endothelium in the body of an individual,
and for diagnosing and treating a proliferative disease or condition
involving the vascular endothelium (preferably, neovasculature) such as
cancer, psortiasis diabetic retinopathy, atherosclerosis or menorrhagia.
The ECSM4 proteins are also useful in the manufacture of diagnostic or
prognostic agent for such conditions. The proteins are also useful for
detecting endothelial damage or activation, detecting a tumour or tumour
neovasculature, cardiac disease, or endometriosis by detecting the amount
neovasculature, cardiac disease, or endometriosis by detecting the amount
of ECSM4 present in a sample. The polymucleotide sequences encoding ECSM4
are useful in gene therapy for treating a hypoxic condition such as
cancer, cardiac disease, endometriosis or atherosclerosis and in the
manufacture of medicaments for treating the above disease. The sequences
are useful for modulating angiogenesis in an individual. The present
sequence represents a RT-PCR primer for RNA encoding human connective

The invention relates to a method for immobilising a molecule on a support comparing reacting a derivatised molecule with a derivatised support capable of reacting with the molecule via a cycloaddition reaction. The method is used for immobilising molecules on a support using cycloaddition reactions such as the Diels-Alder reaction. The method shows better chemoselectivity, functional groups do not need to be protected and it is highly efficient for immobilishing molecules compared to other methods. The present sequence is that of an oligonucleotide, useful to the invention
                                                                                                                                                                                                                                                                               New method for immobilizing a molecule on a support comprises reacting derivatized molecule with a derivatized support via a cycloaddition reaction, shows high selectivity and efficiency.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for the synthesis of a polynucleotide which involves coupling a second nucleoside to a first nucleoside through a phosphite linkage, where the second nucleoside has a non-carbonate protecting group protecting a hydroxyl, and exposing the product to a composition which concurrently oxidizes the phosphite formed to a phosphate and deprotects the protected hydroxyl of the second for carrying out either 3' to 5' to 3' synthesis and for fabricating an addressable array of polynucleotides on a substrate. The present sequence is an oligonucleotide produced to demonstrate the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                     Synthesis of polynucleotide useful during fabrication of an array involves coupling nucleoside phosphoramidite and a solid-supported nucleoside and treating the product with an oxidation/deprotection

The invention relates to a method for immobilising a molecule on a support comparing reacting a derivatised molecule with a derivatised support capable of reacting with the molecule via a cycloaddition reaction. The method is used for immobilising molecules on a support using cycloaddition reactions such as the Diels-Alder reaction. The method shows better chemoselectivity, functional groups do not need to be protected and it is highly efficient for immobilising molecules compared to other methods. The present sequence is that of an oligonucleotide, useful to the invention
New method for immobilizing a molecule on a support comprises reacting a derivatized molecule with a derivatized support via a cycloaddition reaction, shows high selectivity and efficiency.
                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 20 BP; 0 A; 0 C; 10 G; 10 T; 0 U; 0 Other;

Detection device useful for detecting binding between members of specific binding pair, and for multiparallel thermal analysis of samples, has an array of addressable thermistors.

Example 2; Page 36; 60pp; English

The present sequence is that of a (CA)10 oligonucleotide used to illustrate the method of the invention. The invention provides methods for detecting specific binding interactions through measuraing the heat of binding generated when members of specific binding pairs interact with each other. The invention also provides methods to detect analytes in a solution through measurement of the heat of binding or reaction generated from the interaction of the analytes with binding or reaction parents. Detection devices are provided that consist of spatially addressable arrays of thermistors, which are useful in the multiparallel thermal analysis of samples. The methods and devices are particularly in the analysis of nucleic acids, especially DNA/DNA, DNA/RNA, DNA/LNA (linear

The present sequence is that of a (TG)10 oligonucleotide used to illustrate the method of the invention. The invention provides methods illustrate the method of the invention. The invention provides methods for for detecting specific binding plants inceract with each other. The invention also provides methods to detect analytes in a solution through measurement of the heat of binding or reaction generated from the interaction of the analytes with binding or reaction partners. Comparise of termistors, which are useful in the multiparallel thermal analysis of thermistors, which are useful in the multiparallel thermal analysis of nucleic acids, especially DNA/DNA, (linear nucleic acid). The binding between the analyte and its binding partner comprises part of an enzymatic amplification reaction, especially PCR or primer extension reaction. The detection device provides a real time, digital profile of the binding or reaction between the analyte and its binding or reaction partner. An example from the invention, using the

This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGP) by antisense oligonucleotides. CTGF has been mapped to human chromosome region 6q23.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBP-FP2, IGSPB-RP 1684 and ecogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           insulin-like growth factor binding protein-related protein 2, IGFBP-rP2, IGFBP-8, Hos24, ecogenin, acute lymphoblastic leukaemia, gene therapy, hyperproliferative disorder, cancer, pulmonary fibrosis, renal fibrosis, scleroderma, atherosclerosis, cytostatic, dermatological,

associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (particularly cancer, e.g. breat, protecte or renal cancer), pulmonary fibrosis, ranal fibrosis, scleroderma and atheroselerosis. As such, the present invention describes these antisense oligos as having cycostatic, dermatological and antiarteriosclerotic activities. This with 2' MOE wings and a deoxy gap, which is used to inhibit expression of human CTGF of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or atheroscierosis.

CTGF has been mapped to human chromosome region 6g3.1, and is also known as currently clisted to human chromosome region 6g3.1, and is also known as ctgrofact, fibroblast inducible secreted protein. fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBP-FP, IGFBP-8, Hest4 and ecogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (particularly cancer, eg. breast, prostate or renal cancer), conjugnorary fibrosis, renal fibrosis, scleroderma and atherosclerosis. As such, the present invention describes these antisense oligos as having cytostatic, dermatological and antiarteriosclerotic activities. This coligonucleotide sequence is a chimeric phosphorothhoate antisense oligo with 2, MOE wings and a deoxy gap, which is used to inhibit expression of human CTGF of the invention.

New antisense oligonucleotides for modulating connective tissue growth

```
This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 643.1, and is also known as tggrofact, fibroblast inducible secreted protein, fisp-12, NOVZ, insulin-like growth factor binding protein-related protein 2, IGFBF-FP2, CG IGFBF-B, HGSZ4 and ecogenin. It is known to stimulated DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the various conditions including hyperproliferative associated with the various conditions including hyperproliferative content inhibit the expression of CTGF in cells or tissues can be used in that inhibit the expression of CTGF in cells or tissues can be used in the therapy to treat various conditions including hyperproliferative disonary fibrosis, renal fibrosis, scleroderma and atherosclerosis. As such, the present invention describes these antisense oligos as having cytostatic, dermatological and antiarteriosclerotic activities. This collidonucleotide sequence is a chimeric phosphorothicate antisense oligo with 2, MOE wings and a deoxy gap, which is used to inhibit expression of thuman CTGF of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
ractor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 623:1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBP-rP2, CTG insulin-like growth factor binding protein-related protein 2, IGFBP-rP2, CTG GrBP-B-W Hos24 and ecogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (particularly cancer, e.g. breast, prostate or renal cancer), culmonary fibrosis, renal fibrosis, scleroderma and atherosclerosis. As such, the present invention describes these antisense oligos as having cytostatic, dermatological and antiarteriosclerotic activities. This cillonucleotide sequence is a chimeric phosphorothicate antisense oligo with 2, MOE wings and a deoxy gap, which is used to inhibit expression of human CTGF of the invention. New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or atherosclerosis. New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or atherosclerosis.

Claim 3; Page 85; 139pp; English.

This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 643.1, and 18 also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NoV2, insulin-like growth factor binding protein-related protein 2, IGFBP-rP2, IGFBP-8, Heest and ecogenin. It is known to stimulated DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disochers (particularly cancer, e.g. breast, prostate or renal cancer), culmonary fibrosis, renal fibrosis, scleroderma and atherosolerosis. As such, the present invention describes these antisense oligos as having cytostatic, dermatological and antiarteriosclerotic activities. This coligonucleotide sequence is a chimaric phosphorothicate antisense oligo with 2, MOB wings and a deoxy gap, which is used to inhibit expression of human CTGF of the invention.

ADB25666;

This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 6423.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBP-FP2, CTGFP-B, RGS4 and ecogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative clascifers fibratis, rehal fibrosis, scleroderma and atherosclerosis. As such, the present invention describes these antisense oligos as having cytostatic, dermatological and antiatraticsclerotic activities. This cligonucleotide sequence is a chimeric phosphorothicate antisense oligo with 2 MOE wings and a deoxy gap, which is used to inhibit expression of human CTGF of the invention. New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or insulin-like growth factor binding protein-related protein 2; IGFBP-rP2; IGFBP-8; Hcs24; ecogenin; acute lymphoblastic leukaemia; gene therapy; hyperprofilerative disorder; cancer; pulmonary fibrosis; renal fibrosis; scleroderma; atherosclerosis; cytostatic; dermatological; antiarteriosclerotic. /note= "OTHER= phosphorothicate backbone, where 1-5 and 16-20 are 2' methoxyethyl nuclectides. This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 6q3.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBF-FF2, IGFBF-FF2, GTGFBF-F, Hass4 and ecogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (particularly cancer, e.g. breast, prostate or renal cancer), culmonary fibrosis, renal fibrosis, solaroderma and atherosclerosis. As such, the present invention describes these antisense oligos as having cytostatic, dematological and antiarteriosclerotic activities. This entities of the control of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or atherosclerosis.

This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 6421, and is also known as crgoridact, fibroblast inducible secreted protein, fisp-12, NOV2.

CTGF has been mapped to human chromosome region 6421, and is also known compared the cogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (particularly cancer, e.g. breast, prostate or renal cancer), culmonary fibrosis, renal fibrosis, scleroderma and atherosclerosis. As such, the present invention describes these antisense oligos as having cytostatic, dermatological and antiarteriosclerotic activities. This oligonucleotide sequence is a chimeric phosphorothicate antisense oligo with 2 MoB wings and a deoxy gap, which is used to inhibit expression of tuman CTGF of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note= "OTHER= phosphorothioate backbone, where 1-5 and 16-20 are 2' methoxyethyl nucleotides. All cytidines are 5-methylcytidines"

This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides. CTGF has been mapped to human chromosome region 623.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBP-rP2, IGFBP-R, MOS2, and eogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukeemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperprollferative

New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or atherostlerosis.

Example 15; Page 86; 139pp; English.

This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonuclectides. CTGF has been mapped to human chromosotian region 6q23.1, and is also known as ctgrofact, fibroblast inducible secreted procein, fisp-12, NOV2.

New antisense oligonucleotides for modulating connective tissue growth factor expréssion, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or atherosclerosis.

ô insulin-like growth factor binding protein-related protein 2, IGFBP-FP2, IGFBP-8, Hcs24 and ecogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblastes, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligomucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (particularly cancer, e.g. breast, prostate or renal cancer), pullmonary fibrosis, renal fibrosis, scleroderma and atherosclerosis. As such, the present invention describes these antisense oligos as having cytostatic, dermatological and antiatteriosclerotic activities. This oligomuclocide sequence is a chimeric phosphorothioate antisense oligo with 2, MOE wings and a deoxy gap, which is used to inhibit expression of human CTGF of the invention. /mod_base= OTHER /note= "OTHER= phosphorothicate backbone, where 1-5 and 16-20 are 2, methoxyethyl nucleotides. ```
This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGP) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 6d21, and is also known as etgrofact, fibroblast inducible secreted protein, fisp-12, NoV2, insulin-like growth factor binding protein-related protein, 10 GFBP-rp2, IGFBP-8, HGS24 and ecogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in carte Inymbholastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in the capture various conditions including hyperproliferative disorders (particularly cancer, e.g. breast, prostate or renal cancer), columnnary fibrosis, renal fibrosis, scleroderma and atherosclerosis. As such, the present invention describes these antisense oligos as having cycostatic, dermatological and antiatreriosclerotic activities. This coligonucleotide sequence is a chimeric phosphorothicate antisense oligo the contract of the coligonucleotide acquence is a chimeric phosphorothicate antisense oligo the contract of the coligonucleotide adexy gap, which is used to inhibit expression of the contract of the coligonucleotide acquence o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Location/Qualifiers

This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 6423.1, and is also known as ctgrofact, flibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBF-rP2, IGFBF-RP8, SH Hess and cogenin. It is known to sfimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (particularly cancer, e.g. braast, prostate or renal cancer), culmonary fibrosis, renal fibrosis, scleroderma and atherosclerosis. As such, the present invention describes these antisense oligos as having cytostatic, dermatological and antiarteriosclerotic activities. This oligonucleotide sequence is a chimaric phosphorothioate antisense oligo with 2 MOE wings and a decxy gap, which is used to inhibit expression of human CTGF of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "OTHER= phosphorothioate backbone, where 1-5 and 16-20 are 2' methoxyethyl nucleotides. All cytidines are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antisense; human; ss; connective tissue growth factor; CTGF; ctcomosome 6g2.1; ctgrofact; fibroblast inducible secreted protein; fisp-12; NOV2; insulin-like growth factor binding protein-related protein 2; IGFBP-rP2; IGFBP-s; HGS24; ecogonin; auter lymphoblastic leukaemia; gene therapy; hyperproliferative disorder; cancer; pulmonary fibrosis; renal fibrosis; scleroderma; atherosclerosis; cytostatic; dermatological;

connective tissue growth factor (TGTS) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 693.1, and is also known as ctgrofact, fibroblast inducible screted protein, fish-12, NOV2, insulin-like growth factor binding protein-related protein, 169p-12, NOV3, insulin-like growth factor binding protein-related protein 2, IGFBP-r2, IGFBP-r8, McSt4 and ecogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (garticularly cancer, e.g. breast, prostate or renal cancer, pulmonary fibrosis, renal fibrosis, scleroderma and atherosoclerosis. As such, the present invention describes these antisense oligos as having cytostatic, dermatological and antiarteriosclerotic activities. This colloquicle sequence is a chimeric phosphorothhoate antisense oligo with 2, Mos wings and a deoxy gap, which is used to inhibit expression of
                                                                                                                                                                                                        New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     insulin-like growth factor binding protein-related protein 2; IGRBP-rP2; IGRBP-8, Hcs24; ecogenin; acute lymphoblastic leukaemia; gene therapy; hyperproliferative disorder; cancer; pulmonary fibrosis; renal fibrosis; scleroderma; atherosclerosis; cytostatic; dermatological;
                                                                                                                                                                                                                                                                                                                                                             This invention relates to novel methods for modulating the expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /mod_base= CTHER

This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonuclectides.

CTGF has been mapped to human chromosome region 623.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein, 2, IGFBP-rP2, IGFBP-RP8, Hossy and second protein it is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative gene therapy to treat various conditions including hyperproliferative planting protein of protein and atherosclerosis. As such, the present invention describes these antisense oligos as having cytostatic, dermatological and antiatteriosclerotic activities. This coligonucleotide sequence is a chimeric phosphorothicate antisense oligo with 2 MoB wings and a deoxy gap, which is used to inhibit expression of human CTGF of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                      factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            insulin-like growth factor binding protein-related protein 2; IGFBP-rP2; IGFBP-8; Hcs24; ecogenin; acute lymphoblastic leukaemia; gene therapy; hyperproliferative disorder; cancer; pulmonary fibrosis; renal fibrosis; scleroderma; atherosclerosis; cytostatic; dermatological; antiarteriosclerotic.
16-20 are 2' methoxyethyl nucleotides. All cytidines are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides for modulating connective tissue growth

New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or atherosclerosis.

Example 15; Page 85; 139pp; English.

This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonuclocides.

CTGF has been mapped to human chromosome region 6423.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein. 2 IGFBP-rP2, CTGFBP-8, Growth factor binding protein-related protein. 2 IGFBP-rP2, CTGFBP-8, Growth factor binding protein-related protein. 2 IGFBP-rP2, CTGFBP-8, Growth factor binding protein. This synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells asociated with the vasculature. Accordingly, antisense can be used in that inhibit the expression of CTGF in cells or tissues can be used in genether aparticularly cancer, e.g. breast, prostate or renal cancer), pulmonary fibrosis, renal fibrosis, scleroderma and atherosclerosis. As such, the present invention describes these antisense oligos as having cytostatic, dermatological and antiatrenicoclarotic activities. This course of the invention and adexy gap, which is used to inhibit expression of the contract of the human CTGF of the invention. %XGCGGGGGGGGGGGCGX8XBBBBXBXBXBXBXBXBXBXBXBXBXBXBXBX8XXBXBXBX

WO2003053340-A2 Key modified_base Homo sapiens 03-JUL-2003

This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGP has been mapped to human chromosome region 623.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBP-rP2, CTG TGFPP- Has decognin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in the capter inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (particularly cancer, e.g. breast, prostate or renal cancer), pulmonary fibrosis, renal fibrosis, scleroderma and atherosclearis. As such, the present invention describes these antisense oligos as having cycostatic, dermatological and antiatreriosclerotic activities. This clidonucleotide sequence is a chimeric phosphorothicate antisense oligo with 2, MoE wings and a decoy gap, which is used to inhibit expression of human CTGF of the invention. This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides. CTGF has been mapped to human chromosome region 6q23.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein 2, IGFBP-FP2, IGFBP-8, HGS24 and ecogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in
                                                                                                                                                             ö

                                                                                                                                                                                                oligonucleotide sequence is a chimeric phosphorothioate antisense oligo with 2' MOE wings and a deoxy gap, which is used to inhibit expression of human CTGF of the invention.
acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligomucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperproliferative disorders (particularly cancer, e.g. breast, prostate or renal cancer), pulmonary fibrosis, renal fibrosis, sclockers these and atherosclerosis. As such, the present invention describes these antisense oligos as having cytostatic, dermatological and antiarteriosclerotic activities. This

New antisense oligonucleotides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or or prostate cance atherosclerosis.

Example 15; Page 85; 139pp; English

```
This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 6421, and is also known as ctgrofact, fisp-12, NOV2.

CTGF insulin-like growth factor binding protein-related protein 2, IGFBF-FP2, insulin-like growth factor binding protein-related protein 2, IGFBF-FP2, CTGF promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial cells associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in CTGF in cells or tissues can be used in CTGF in cells or tissues can be used in CTGF particularly cancer, e.g. breast, profetter or renal cancer, condimonary fibrosis, renal fibrosis, scleroderma and atherosolerosis. As such, the present invention describes these antisense oligos as having cycostatic, dermatological and antiarteriosclerotic activities. This coligonucleotide sequence is a chimeric phosphorothicate antisense oligo with 2, MOE wings and a deoxy gap, which is used to inhibit expression of thuman CTGF of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antisense; human; ss; connective tissue growth factor; CTGF; chromosome 6q23.1; ctgrofact; fibroblast inducible secreted protein; fisp-12; NOV2; insulin-like growth factor binding protein-related protein 2; IGFBP-rP2; IGFBP-8; HcG24; ecogenin; acute lymphoblastic ladvaemia; gene therapy; hyperproliferative disorder; cancer; pulmonary fibrosis; renal fibrosis; scheroderma; atherosclerosis; cytostatic; dermatological;

New antisense oligonuclectides for modulating connective tissue growth factor expression, particularly useful for treating cancers (e.g. breast or prostate cancer), pulmonary or renal fibrosis, scleroderma or atherosclerosis.

Claim 3; Page 85; 139pp; English.

This invention relates to novel methods for modulating the expression of connective tissue growth factor (CTGF) by antisense oligonucleotides.

CTGF has been mapped to human chromosome region 6423.1, and is also known as ctgrofact, fibroblast inducible secreted protein, fisp-12, NOV2, insulin-like growth factor binding protein-related protein. 2 IGFBP-rP2, IGFBP-P8, HCS24 and ecogenin. It is known to stimulate DNA synthesis and promote chemotaxis of fibroblasts, however, it is also upregulated in acute lymphoblastic leukaemia and in tumour or endothelial calls associated with the vasculature. Accordingly, antisense oligonucleotides that inhibit the expression of CTGF in cells or tissues can be used in gene therapy to treat various conditions including hyperprolferative pulmonary fibrosis, renal fibrosis, scleroderma and atherosclerosis. As such, the present invention describes these antisense oligons as having cytostatic dermatological and antiarteriosclerotic activities. This oligonucleotide sequence is a chimmeric phosphorothicate antisense oligo with a man and a decxy gap, which is used to inhibit expression of the man of the companient of the contraction of the contrac human CTGF of the invention.

Treating systemic lupus erythematosus comprises selecting an individual having significantly impaired renal function and administering conjugate having non-immunogenic valency platform molecule and double stranded DNA epitopes

Claim 3; Page 18; 22pp; English.

The present invention relates to a method of treating systemic lupus erythematosus (SLE) in an individual. The method comprises selecting an individual having SLE, significantly impaired renal function, and antibodies with high affinity to a polymucleotide epitope by administering a conjugate comprising non-immunogenic valency platform molecules and two or more double stranded DNA (GDNA) epitopes that are polymucleotides. Also disclosed is a kit comprising the conjugate, LJP 394. The conjugate is administered in an amount effective to reduce incidence of renal flares in the individual. A medication chosen from corticosteroids and cyclophosphamide is also administered to the individual. The conjugate is administered in an amount effective to reduce the amount of a corticosteroid or cyclophosphamide administered to the individual. The present sequence represents a polynucleotide (dsbDNA) used in the treatment of SLE.

Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding. WPI; 1992-284684/34.

Table 7; Page 336; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information in the bovine phovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the

The method comprises subcutaneous administration of an oligomucleotide (OGN). AAX90288 to AAX90291 represent specifically claimed OGNs for use in the method. The OGNs are used for the treatment of immune system-mediated diseases. AAX90292 to AAX90232 represent oligomucleotides used in the example exemplification of the present invention
required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentese testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective becomeding. The present sequence is that of a synthetic oligonuclectide useful to the invention. The invention relates to a composition, comprises multiple base 3'-04, 5'-05 synthetic oligonuclectide which comprises multiple repeats of dinuclectides such as GT, TG, etc., according to specific formula and having cytostatic activity. The oligonuclectide compositions are useful for inducing cell cycle arrest, inhibition of proliferation, activation of apoptosis or production of activation of caspases and induction of apoptosis or production of cytokines such as interleukin (IL) 1-beta, IL-6, IL-10, IL-12 and tumour necrosis factor (INF)-alpha by immune system cells, in an animal having cancer such as primary carcinoma, secondary carcinoma, present, prostate, colorectal, ovarian or bone cancer. The compositions induce apoptosis cindependent of Fas, p53/p21, p21/waf-1/CIP, p15(ink4B), p16(ink4), drug resistance, caspase 3, transforming growth factor (TGF)-beta 1 receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present invention describes a phosphoramidite compound (I) comprising two or more nucleoside moieties linked by one or more internucleoside phosphorus atoms, where the internucleoside phosphorus atoms, where the internucleoside phosphorus atoms is toward. Also described: (I) preparing a trivalent phosphorus multimer or its stereoisomer (I); (2) a trivalent phosphorus multimer derivatised solid support (II); and (3) preparing (II). (I) or (II) can be used for the synthesis of oligonucleotides. The present sequence represents a phosphorothioate 21mer oligonucleotide which is synthesised in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, zinc finger protein 9.46; recombinant production, gene therapy, malignant tumnour; cancer; blood disease; human immunodéficiency virus; HIV infection; immune disorder, inflammatory condition; cytostatic; antiinflammatory; immunomodulator; reverse transcription-PCR; RT-PCR;
                                                                                                                                                                                                                                                                                                                                                      Novel phosphoramidite compound, useful for the synthesis of oligonucleotides, comprising nucleoside moieties linked by one or more internucleoside phosphorus atoms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human zinc finger protein 9.46 RT-PCR primer, SEQ ID NO:3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            / Match 1.9%; Score 20; DB 1; Length 21; Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a phosphoramidite compound (I) comprising two or more nucleoside moieties linked by one or more internucleoside phosphorus atoms, where the internucleoside phosphorus atoms. Also described: (I) preparing a trivalent phosphorus (III) atoms. Also described: (I) preparing a trivalent phosphorus multimer or its stereoisomer (I); (2) a trivalent phosphorus multimer derivatised solid support (II); and (3) preparing (II). (I) or sequence represents a phosphorochioate 2 iner oligonucleotide which is synthesised in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel phosphoramidite compound, useful for the synthesis of oligonuclectides, comprising nucleoside moieties linked by one or more internucleoside phosphorus atoms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Phosphorothioate; oligonucleotide synthesis; phosphoramidite; ss.
                                                                                  Phosphorothioate; oligonucleotide synthesis; phosphoramidite; ss.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonuclectide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the Frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information
                                                                                                                                          The invention relates to human zinc finger protein 9.46 (ABP58904) and nucleic acids encoding it (ABZ57677). The protein has a molecular weight of 9.46 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein gene and antagonist in therapeutic applications. Zinc finger protein 9.46 can be used in the treatment of a variety of diseases such as malignant tumours, blood diseases, HV (human immunodeficiency virus) infection, immune disorders and inflammatory conditions. Sequences ABZ57679 represent reverse transcription-PCR (XT-PCR) primers used in an exemplification of the invention to isolate human zinc finger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.
                                                          New polypeptide human zinc finger protein 9.46 and polynucleotides encoding this polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PCR; selection; primers; OPTIPRIM; breeding; cattle; parentage; genetic mapping; traits; amplification; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Anti-sense oligo:nucleotide(s) for blocking ICAM-1 mRNA translation - for treating septic shock, adult respiratory distress syndrome etc.
for ca. 230 such bowine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AATS8071-85 represent oligonucleotides which are antisense to sequences contained in the pre-mRNA or mature mRNA transcript of human intercellular adhesion molecule-1 (ICAM-1). These oligonucleotides may be used for treating septic shock and the manifestations of septic shock, e.g. inflammation, and vascular and tissue defects. They are also useful in the treatment of septic shock associated diseases, e.g. adult respiratory distress syndrome, multiple organ failure etc. (Updated on 25-MAR-2003 to correct PF field.)
